Career Counseling and an Entrepreneurship Development Program Special guest Mr. MIR MUSTAF

Students have a lot of decisions to make while they're in college. These range from which courses to take up apart from their core subjects, to deciding which internships would benefit their career. However, the single biggest decision that any college student needs to make revolves around what to do after college. As a matter of fact, almost every other choice that a student makes in college revolves around his/her plans after college, be it studying further or taking up a job. Deciding what to do after college has a significant impact on your immediate future as well as long term goals. This decision gets difficult because there are several factors that impact it, such as interests, costs, opportunities etc. For example, you might realize while pursuing your degree that your true passion lies somewhere else, and you might decide to pursue a career in that field after college. But what if that career requires you to pursue a separate course after your graduation, something that you're not willing to do?

To ensure that you don't make a wrong decision at this crucial juncture in your life, it helps to consult a Career Counselor. A Career Counselor will guide you through this whole decision making process and will give suggestions that are beneficial for you with regards to whether you should take up a job after college or pursue a postgraduate course.

Additionally, a Career Counselor will also help in developing contingency plans in case things don't work out (not getting admission in the desired course or not getting a job etc.). Not only that, but he/she will also help you make decisions in case you wish to alter your career goals after college. In such scenarios, a Career Counselor will help you decide whether it is worth it to completely change your career focus or not, and if yes, then should you first take up a course in that career or directly apply for a job.

Our goal is to nurture the talents of the students, empowering graduates who will flourish and change the world for better.

## **Some Major Main Problems in Civil Engineering**

What are the problems of civil engineer in the construction field?

### **Some Best Points are given:**

- you are in any Country, and going to start your career as a civil engineer. Then, trust me, buddy, you should be mentally prepared at first.
- If you know how to read drawing works get smoother to you.
- You have to face all climate & weather problems without complaining.
- If you opt in the private company or under contractor than be prepared to work for 12-14 hours almost every day (12 Hours Mandatory)
- You have to deal with all type of people (includes labour to project manager & clients too)
- You cannot talk to everyone, in the same manner, every time. You have to get your work done from labour (who knows far more work than fresher)
- You have to learn the things yourself, none helps you honestly. (In all types of jobs especially in civil )
- If you are a graduate engineer than at most of the site you have to take a taunt "you should know this, you are a degree holder engineer"
- You should be aware & have some patience to listen to some abusive comments.
- You will face irregular and disruptive salary.
- And after all its a 7-day working job, (No holidays, No weekends)
- You probably don't want to go home as you work 14 hours a day without getting a week off ( forget sat Sunday, no holiday even on Sunday) Amavasya is your – Independence day/ Diwali/ new year everything, that's the day you will get an off in the whole year.
- You don't want to wear nice clothes since at the end of the day you will look like a laborer.

After completing the project, when there will be inauguration of the building, you will be asked by security to stay out & you will look at the site from far standing, kidding with your colleagues & supervisors while having last cutting chai at a tapri, with a smile on your face you move on to a next site.

The only thing which gonna help you out there at the construction site, is your passion, dedication hard work, self-motivation & yeah keep aside your ego but hold on the self-respect every time. (for all type of jobs) you should know how to work under pressure & how to deal with pressure.

Construction Sites are the real challenges for everyone. The civil engineer is the key person that leads paper drawing into real physical things. There are so many predictable as well

as unwelcome unpredictable problems in the site. Some of the major site problems are.

Changes in design standards. It might be due to variation in actual site conditions.

The untimely reach of construction materials. This might leads to delay in project time

### **Industries/Fields**

**Health and Safety Problems** – There are just so many potential hazards on Civil Engineering construction sites, which is why the industry has one of the highest percentages of deaths and lost time injuries! Incidents can cause sites to be immediately shut down and investigated. Rules are different for different jurisdictions, however in my experience health and safety is the largest risk when managing a construction site. As a result, there will be a health and safety plan which must be adhered to at all times.

**Environmental Problems** – environmental hazards can also get sites closed down until remedial action is taken. This includes contamination, sediment runoff, natural disasters. These result from the underlying site conditions, weather, natural disasters, and damage to site controls. On a project I was monitoring old asbestos pipes were found under the ground, contaminating surrounding soil. This required the site to be temporarily closed while specialist teams removed the contaminated material.

**Contractual Disputes** – I'm not an expert in this area, but these can arise for a number of reasons, including variations to the work, damage to property onsite, payment claims, defects in workmanship etc. It is therefore extremely important for everyone involved to understand everything in the contract before signing and undertaking any work. As a civil engineer you likely have the responsibility of drafting the contract, and making sure work is undertaken accordingly. You will need to approve any variations to the contract and resolve any issues that arise.

All the above issues can have significant cost and time implications.
